

Original bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and have been scanned and collected by SGA Storia Geofisica Ambiente (Bologna) thanks to funding provided by the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

The International Seismological Summary for 1919.

FORMERLY THE BULLETIN OF THE
BRITISH ASSOCIATION SEISMOLOGY COMMITTEE.

The present number contains the information for January, February, and March, 1919, thus commencing the second year of the International Summary—the successor to the Shide and Oxford Bulletins.

Attention may be called to the following cases of "deep focus":—

	Date. d. h. m. s.	Epicentre. ° ° °	Focal Depth. +·080
Jan.	1 3 0 0	20·5N. 178·5W.	+·080
Mar.	1 18 36 0	9·0N. 141·0E.	+·080
Mar.	2 3 26 40 11 45 10 9 3 16 45 } 13 14 16 55	48·7S. 77·0W. 8·5S. 124·5E.	+·020 (Suggested)
	16 7 33 10 15 3 0 }	9·5N. 127·0E.	+·015

In some of these cases a discussion of the evidence is given: in others the figures are left to speak for themselves. Instances of abnormal focal depth are apparently not numerous, but they are steadily accumulating, and fuller discussion may be reserved until a sufficient number have been collected.

The welcome news has been received that the Russian Seismological Observatories are being revived, and a few records have been received from Ekaterinburg. Hence, though the number of stations sending records is already large in 1919 (the year of emergence from the War), we may apparently hope for an increase in subsequent years.

H. H. TURNER.

University Observatory, Oxford.
1928 December 21.

Original bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and have been scanned and collected by SGA Storia Geofisica Ambiente (Bologna) thanks to funding provided by the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

1919 JANUARY, FEBRUARY, & MARCH.

1919. Jan. 1d. 1h. 33m. 36s. Epicentre 5°4N. 125°2E.

(as on 1918 Oct. 26d. and on many previous occasions.)

$$\begin{aligned} A = -574, \quad B = +813, \quad C = +094; \quad D = +817, \quad E = +576; \\ G = -054, \quad H = +077, \quad K = -996. \end{aligned}$$

The Epicentre, used so often before, has been retained for convenience of reference, but the residuals suggest one further north.

Zi-ka-wei	17.3	202	—	—	—	—	e 7.8	—
Taihoku	23.5	197	—	—	—	—	10.6	15.6
Manila	33.6	194	—	—	—	—	(17.7)	—
Ekaterinburg	41.1	309	—	e 14 23	+ 1	20.7	28.3	—
Edinburgh	69.1	333	36 20	?L	—	—	(36.3)	—
De Bilt	69.5	327	—	—	—	—	e 36.7	38.0
Eskdalemuir	69.6	333	—	—	—	—	37.7	—
Helwan	73.3	296	45 40	?L	—	—	(45.7)	—

Additional records : De Bilt gives MN = +45.2m. Helwan PN = +49m.40s. Manila gives its record at 7m. This has been corrected to 27m.

Feb. 14d. Records also at 8h. (Ekaterinburg), 10h. (La Paz), 13h. (San Fernando), 14h. (Osaka and Kobe), 18h. (Monte Cassino and Rocca di Papa), 22h. (Tokyo), 23h. (Helwan).

Feb. 15d. 2h. 17m. 17s. Epicentre 68°.2N. 13°.0W.

$$A = +362, B = -848, C = +929; D = -225, E = -974; \\ G = +905, H = -209, K = -371.$$

The observations were compared with the epicentre adopted on 1917 July 9, and possibly on 1917 Nov. 7, viz., 64°.0N. 20°.0W.; but it was clear that the change would be in the wrong direction. A better solution would perhaps be T₀ = 2h.17m.3s., 70°.0N., 11°.0W.

21

Feb. 24d. Records also at 8h. (San Fernando), 9h. (Athens), 21h. (Manila).

Feb. 25d. 22h. 38m. Slight shock recorded near Berkeley and Lick. Probably not from the same origin as that on Feb. 16d., as the Lick records are so much later than those of Berkeley. Berkeley iP = +52s., iL = +60s., MEN = +62s., and MZ = +66s. Lick ePEN = +67s., iLN = +81s., eLE = +83s., MN = +83s., ME = +88s. La Paz P = +45m.57s.

Feb. 25d. Records also at 0h. (San Fernando and Riverview), 1h. (Tokyo and Mizusawa), 8h. (La Paz and Taihoku), 9h. (Athens), 11h. (Helwan), 12h. (Apia), 13h. (Ekaterinburg and Taihoku (2)), 15h. (Helwan and La Paz), 16h. (La Paz), 19h. (San Fernando and Taihoku), 21h. (Rocca di Papa).

Feb. 26d. Records at 9h. (Manila and Ekaterinburg), 10h. (Helwan and Batavia), 23h. (San Fernando).

Feb. 27d. Records at 8h. (Ekaterinburg and Helwan), 9h. (Hamburg), 14h. (Ekaterinburg and Helwan), 22h. (San Fernando).

Feb. 28d. Records at 8h. (Manila), 10h. and 11h. (Ekaterinburg), 13h. (Jamaica), 23h. (La Paz).

Mar. 1d. There are great difficulties in reconciling the records. We have only three records of S and P, viz.—

	P.	S-P.	Δ	T _o
	h. m. s.	m. s.	°	h. m. s.
Tokyo	13 39 14	2 47	14.5	13 35 41
Manila	13 40 21	4 12	23.5	34 58
Ekaterinburg	13 47 40	9 28	73.3	36 2

If Manila is 1 minute in error we get fair agreement at 13h.35m.54s. Ekaterinburg gives for the epicentre 13°47'N. 141°24'E. On 1917 Nov. 24 an epicentre near that place was adopted, viz., 13°55'N. 143°0'E., but the residuals for Riverview are -25s. in P and -44s. in S, shewing that the epicentre should be 3°.5 nearer. An unfortunate slip in computation for Melbourne obscures its evidence: Δ should be 51°.3 instead of 22°.5, and then the P observation +16m.14s. when treated as S gives a residual -21s. or 1°.9 nearer. The Azimuth should moreover be 178° instead of 353°. A re-examination of the adopted T_o = Nov. 24d.11h.10m.52s., shews that any reasonable alteration of it would emphasise these negative differences. We have 5 determinations in all, and the corrections to T_o indicated are Manila +30s., Mizusawa +23s., Zi-ka-wei -2s., Riverview -1s., Honolulu +3s.; mean +11s.; and by laying stress on the stations nearer the epicentre, a case could be made out for increasing T_o still further. The evidence suggests a deep focus; and the single antipodal residual for La Paz; [-7s.], which becomes [-18s.] if we adopt the mean Correction to T_o, supports this view. If we adopt then a correction of +11s. to T_o and a focal depth of 0.020, the computation would stand as follows for the stations concerned:—

	Δ	Corrn. focus.	P.	O-C.		O-C.
				m. s.	s.	
Manila	21.4	-0.9	e 4 53	+ 5	8 29	- 5
Osaka	22.3	-1.0	5 3	+ 8	—	—
Mizu-sawa	25.7	-1.1	5 27	- 7	9 34	-21
Zi-ka-wei	26.6	-1.2	e 5 40	- 2	e 10 18	+ 7
Batavia	41.0	-1.7	e 7 40	- 9	—	—
Riverview	47.9	-2.0	i 8 17	-22	e 14 58	-29
Sydney	47.9	-2.0	13 57	iS	(13 57)	-90
Melbourne	51.3	-2.1	16 3	iS	(16 3)	- 6
Honolulu	56.5	-2.3	e 9 45	+11	17 39	+28
Colombo	62.4	-2.4	19 57	iS	(19 57)	+94

—and these results may be considered a good approximation. This case has been re-examined thus because, though there seems to be similar evidence of deep focus on 1919 Mar. 1, we have then no record from an antipodal station. But with this support from 1917 Nov. 24 we may adventure the hypothesis of a focus below normal. Trial of the actual epicentre and depth of 1917 Nov. 24d. shewed systematic differences suggesting ultimately a greater depth 0.030, and the epicentre 9°.0N. 141°.0E. Thus—

Original bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and have been scanned and collected by SGA Storia Geofisica Ambiente (Bologna) thanks to funding provided by the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

22

1919. Mar. 1d. 13h. 36m. 0s. Epicentre 9°.0N. 141°.0E.

$A = -768$, $B = +622$, $C = +156$; $D = +629$, $E = +777$;
 $G = -121$, $H = +098$, $K = -988$.

A focal depth 0.030 below normal has been assumed.

25

De Bilt II ePR₁ = +20m.4s. Hamburg I MN = +75.5m. Helwan I PN = +22m.2s., MN = +72.1m. Helwan II PN = +21m.14s., MN = +80.3m. Lemberg I 74m.2s. Batavia I eL₂ = +78.6m., eL₃ = +83.7m. Batavia II eL₂ = +78.8m., eL₃ = +83.8m. Kodaikanal II gives P = +22m.14s. (?PR₁) as part of an earlier shock. Ekaterinburg I iP = +19m.48s., i₁ = +23m.2s., i₂ = +26m.32s., i₃ = +30m.12s., i₄ = +36m.4s. Epicentre 28°30'S. 160°19'E. Osaka I MN = +87.2m. Osaka II MN = +88.7m. Zi-ka-wei gives its eL one hour early. Zi-ka-wei II SR₁E = +45m.0s., SR₁N = +51m.57s., MN = +83.6m.

NOTE TO 1919 MAR. 2 AND 9.

Some of the residuals for the stations nearest the epicentre are so large as to raise doubts whether the solution is even approximately correct. It seems well therefore to call attention to the following points. The residuals for six N. American stations are as follows :

△	Az.	P Residuals.			S Residuals.		
		2d.3h.	2d.11h.	9d.	2d.3h.	2d.11h.	9d.
Georgetown	79.9	358	+7	+8	-	+16	+13
Washington	79.9	358	+2	-2	+4	+9	-4
Harvard	83.4	1	+1	+3	+1	+2	+2
Ithaca	83.5	358	-1	-	-	-3	+3
Chicago	83.6	350	+1	-1	-7	-5	-11
Ottawa	86.4	359	+1	-5	+2	0	-8
Mean			+2	+1	0	+3	-1
							-3

- (1) In view of this concurrent testimony it seems clear that no great alteration of T₀ can be made in any of the three cases.
- (2) The latitude of the epicentre is checked by these stations which lie close to zero azimuth.
- (3) The longitude may be inaccurate, but the residuals for Apia (-1s. for P on Mar. 2d. 3h. and -12s. for S on Mar. 2d. 11h.) in Azimuth 257° are reassuring on this point.
- (4) Nevertheless La Paz has the residuals

△	Az.	P.			S.	
		La Paz	25.0	13	+14s. +4s. +15s.	+53s. +17s. +30s.

The mean value in P is +11s. and in S +33s., indicating that the epicentre should be moved 1°.1 or 1°.8 further away from La Paz. Yet we cannot do this without upsetting the accordance of the N. American stations. As regards other S. American stations :-

Cipolletti and Rio de Janeiro are in azimuths 66° and 64°: they support Apia that the longitude of the epicentre is well determined, but tell us little about latitude. Mendoza is affected by some large error of 3 or 4 min. Pilar in azimuth 44° would support La Paz in requiring a latitude further south; but contradicts Apia, Cipolletti, and Rio de Janeiro as regards the longitude.

Ahdalgala has P residuals -7s. +26s. +57s. The mean value supports La Paz, but the discordances from the mean show that the accidental error is also large.

Vieques gives us no help.

- (5) If we accept the La Paz observations as requiring an epicentre further S. than those of N. America, the only way of reconciling them is by supposing a focus below normal depth. With a depth of 0.020 the epicentre might be moved 2°.7 further South (to 43°.7); and the new △ for La Paz would be effectively

$$25^{\circ}0 \text{ (above)} + 2^{\circ}7 \text{ (new latitude)} - 1^{\circ}2 \text{ (deep focus)} = 26^{\circ}5;$$

while that of a N. American station, say Washington, would be effectively

$$79^{\circ}9 \text{ (above)} + 2^{\circ}7 \text{ (new latitude)} - 2^{\circ}7 \text{ (deep focus)} = 79^{\circ}9.$$

Original bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and have been scanned and collected by SGA Storia Geofisica Ambiente (Bologna) thanks to funding provided by the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

- (6) It may be remarked that this alteration of epicentre brings the focus nearer to Riverview and Adelaide, which lie near azimuth 180°. The effective Δ for Riverview is thus doubly altered

$94^{\circ} \cdot 4$ (above) $-2^{\circ} \cdot 3$ (new latitude) $-2^{\circ} \cdot 8$ (deep focus) = $89^{\circ} \cdot 3$

The large negative residuals

in P. -64s. -17s. -15s. now become -36s. +11s. -23s.
 in S. -74s. -76s. -64s. , " -20s. -22s. -10s.

which is a considerable improvement.

The residuals are still negative and call for a displacement of the epicentre further West to correct them. And this would be supported by Apia, &c., which lie to the East: the increase in Δ for them would be balanced by the correction for focal depth.

- (7) The only values of [P] are for Bombay, Ekaterinburg, and Manila, and show a mean value [-9s.]. For a focal depth .020 this should be about [-17s.].

The evidence taken together therefore points to a moderate focal depth (0.020), though not very strongly; and to an epicentre at (say) $43^{\circ}7S$, $77^{\circ}0W$.

Mar. 2d. 16h. 56m. 50s. Epicentre $34^{\circ}0'N.$ $96^{\circ}0'E.$ (as on 1915 April 28d.)

$$A = -0.87, B = +0.824, C = +0.559$$

Manila	5.5	339	e 1 27	+ 2	2 33	+ 2	3.4	3.8
Batavia	22.5	226	e 5 10	- 1				
Colombo	42.7	270	21 25	?L			(21.4)	
Ekaterinburg	67.1	328	e 10 40	-19	e 19 34	-17	30.4	67.7
De Bilt	98.8	326					e 54.4	55.9

Additional records: Manila gives T₀ = 21h.51m.41s. and an epicentre 11°.7N. 126°.4E. Ekaterinburg i = +10m.42s. De Bilt MN = +55.7m.

Mar. 23d. Records also at 1h. (San Fernando), 2h. (Manila and Denver), 14h. (Mizusawa), 19h. (Lick), 21h. (Mizusawa).

Mar. 24d. Records at 4h. (San Fernando), 8h. (Helwan), 20h. (Helwan and Vieques), 21h. (Helwan).

Mar. 25d. Records at 0h. (San Fernando), 2h. (Taihoku), 3h. (Chicago and Ottawa), 9h. (La Paz), 11h. (Helwan), 14h. (Manila and La Paz), 15h. (Helwan), 18h. and 20h. (Paris).

Mar. 26d. 13h. 34m. 50s. Epicentre 30°.6N. 141°.8E. (as on 1917 July 10d.).

$$A = -677, B = +532, C = +509.$$

Identification very uncertain: for instance, the epicentre 44°.0 131°.0E., as used with deep focus on 1918 April 10d., would suit equally well.
