## EARTHQUAKE INTENSITY SCALE

Intensities are given by Roman numerals in the list of California and Nevada earthquakes on the following page, when sufficient information on the effects of the shock is available. Criteria of the Modified Mercalli Scale which are used to rate the intensity are:

### Intensity

- II Felt by a few people only. Duration or direction not appreciable.
- III Duration or direction appreciable.
- IV Rattling of doors and windows; swinging of suspended objects.
- V Disturbance of movable objects; plaster cracked.
- VI Overthrow of movable objects; cracking of chimneys and other brickwork.
- VII Fall of some chimneys; some damage to buildings.

## EARTHQUAKE MAGNITUDE SCALE

Richter Magnitudes shown in the list of epicenters on the next page are found from the Wood Anderson amplitudes, using the nomogram given by Nordquist, Bull. Seism. Soc. Am., 32:164.

---

Latitude and Longitude are given for each epicenter in the following list. Only those earthquakes are given for which epicenters were located. The letter represents the excellence with which the epicenter has been located, a indicating excellent, b good, c fair, d poor.
