## HAWAIIAN VOLCANO OBSERVATORY SUMMARY 24

By H. L. Krivoy, R. Y. Koyanagi, and A. T. Okamura

### Chronological summary

Coincident with the injection of magma into a long section of Kilauea's east rift zone during the brief 1961 eruption (Sept. 21-25), the summit of the volcano subsided rapidly. Although the total subsidence during the 1961 eruption was only about one half as great as that associated with the 1960 flank eruption at Kapoho, the rate of subsidence in 1961 was far greater than in 1960. In contrast to the 1960 subsidence, which continued slowly for months after the eruption, the 1961 collapse terminated with the eruption, and the cycle of inflation at Kilauea which began late in 1960 resumed. Slow swelling of the volcano continued through the rest of the year.

The tilting diagram (fig. 1) showing the 1961 collapse is based on changes between July 23 and October 8, and it obscures the high rates of subsidence that occurred during the brief eruption. A more detailed, qualitative picture of swelling and subsidence at Kilauea is provided by a graph of the daily readings of the short-base liquid-level tiltmeter in Uwekahuna vault (fig. 2), which summarizes the history of tilting at that station from July 1956 to August 1962. For comparison, tilt coordinates and changes from December 1959 to October 1961 at the Uwekahuna field tilt-base are listed in table 3.

During the later stages of the 1960 collapse, a great swarm of shallow earthquakes originated in and around Kilauea caldera. During February and March 1960, about 350 earthquakes were reported felt, and thousands were recorded by the seismographs. No such swarm of earthquakes at the summit of Kilauea accompanied the 1961 collapse, although many earthquakes originated along the rift zone just before and during the eruption. Apparently the collapse in 1961, like the first week of collapse in 1960, did not strain rocks surrounding the shrinking reservoir beyond the elastic limit. The lower pre-eruption level of the Kilauea summit, the smaller total subsidence, and the earlier cessation of subsidence in 1961, as compared to 1960, might also have checked the development of a swarm of collapse earthquakes in 1961.

Feeble shallow earthquakes at Kilauea caldera averaged about 20 per day throughout the quarter. A sequence of earthquakes from Kilauea's southwest rift zone continued through the quarter; daily counts of these earthquakes ranged from 1 to 31 and averaged about 10.

The most important seismic activity of the quarter originated in a zone about 30 km beneath Halemaumau (southwest edge of Kilauea caldera). Earthquakes from this source became prominent when Kilauea

began to reinflate in the fall of 1960, following the 1960 collapse. During the last quarter of 1961 quakes of this family occurred in groups of 40 or 50 over periods of 2 or 3 hours. About 150 of them were large enough for study. Foci of these earthquakes seemed to follow no regular pattern of migration, but they showed a "normal" scatter which indicated a source region that was broader than it was high.

Daily counts of these earthquakes are shown in table 4. Only one earthquake of this group had a magnitude larger than 2.4 during October; but in November there were 34 such earthquakes, and in December there were 17. The largest earthquakes from this deep source occurred on November 21 (magnitude 3.8), November 23 (magnitude 3.8), November 25 (magnitude 3.7), December 2 (magnitude 3.9), and December 31 (magnitude 3.9). Earthquakes of magnitude 2.9 were at the threshold of sensibility, and nearly all larger ones were reported felt. Ten were reported felt during November and 5 during December.

Most of the other earthquakes felt in Hawaii during this quarter originated in Kona. They are listed in table 5.

#### Tilting of the ground around Kilauea caldera

Tilting of the ground around the summit of Kilauea is monitored daily by a short-base water-tube tiltmeter in Uwekahuna vault (table 1), and at irregular intervals it is measured on a regional scale by means of a network of field tilt-bases and a portable water-tube tiltmeter (table 2). The attitude of the ground surface at each tilt base is reported in terms of north-south and east-west tilt coordinates. Both coordinates at each station were arbitrarily set equal to 500 when measurements at that station were begun. Increasing tilt coordinates correspond to northward and eastward tilting of the earth's surface, that is, to a relative subsidence toward the north and east. A 1-unit change in coordinate corresponds to a tilting of 1 micro-radian (1 mm per km) in the direction indicated.

#### Seismic summary

Events recorded by the U.S. Geological Survey seismograph network in Hawaii fall into two categories: local earthquakes and tremor originating in the region of the Hawaiian Islands, usually within 100 km of at least one seismograph, and distant earthquakes originating more than 3,000 km from Hawaii. As an index of seismic activity at Hawaiian volcanoes, daily counts of earthquakes and minutes of tremor recorded by seismographs in Hawaii are listed in table 4. The earthquakes are separated into groups on the basis of region of origin as determined by analysis of records obtained daily at the Observatory (U, M, A, D, N). Earthquakes of magnitude 2.5 or

greater are generally sufficiently well recorded to be located with greater precision; they are listed individually in table 5. Data on identifiable phases from distant earthquakes are listed in table 6.

Locations of the seismograph stations are shown on figure 3, and essential data on the stations are given in Summary 21.

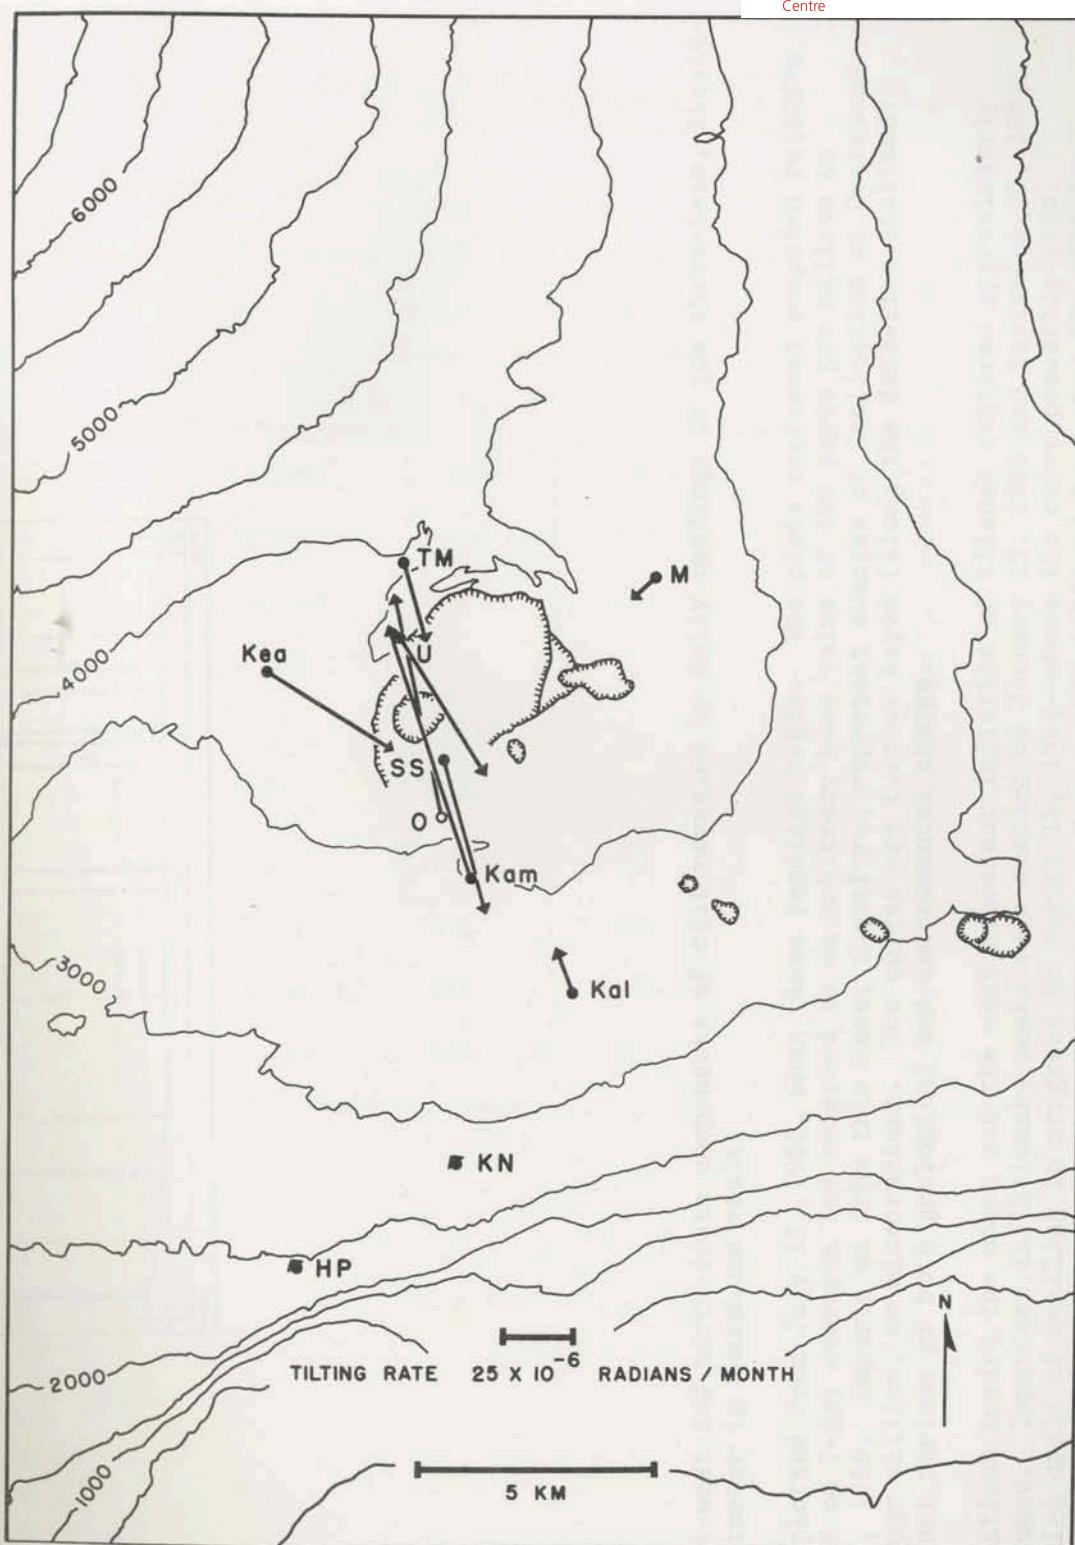

Figure 1.--Tilting of the ground around Kilauea caldera, July 23, 1961, to Oct. 8, 1961. The vector depicting tilting at a given tilt base points in the direction of maximum relative subsidence and has a length proportional to the rate of tilting during the measurement interval. Closed circles represent field tilt bases; open circles, short-base water-tube tiltmeters.

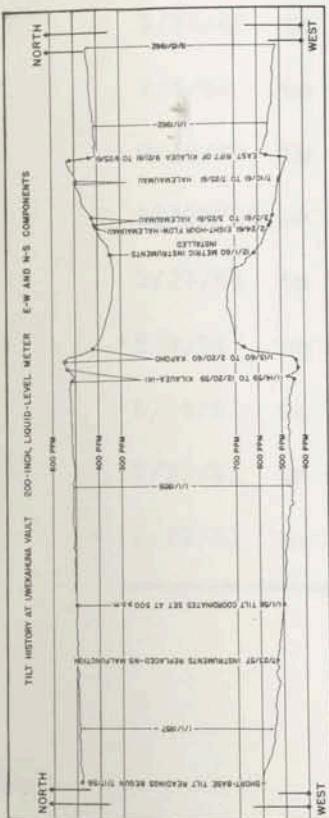

Figure 2.--East-west and north-south components of tilt revealed by daily readings at the short-base, liquid-level tiltmeter in Uwekahuna vault.

Data are plotted from July 17, 1956, when these readings began. The plots represent computed relative tilt based on 7-day averages and referred to an arbitrary base value of 500 parts per million on January 1, 1958. Departures from this base, therefore, represent changes of inclination at Uwekahuna in parts per million, or microradians. The curves are further keyed (along the date-line abscissa) to important periods of both geological and instrumental change.

Tilt variations toward the north and the west represent inflation of Kilauea centered approximately at Halemaumau. Important inflationary peaks were reached on January 12, 1960 and September 20, 1961 with a third cycle of swelling in progress on August 15, 1962--where the curve presently ends. Conversely, deflation such as Kilauea experienced on January 13, 1960 and September 20, 1961 is demonstrated by inclination of this tilt base toward the southeast.

Table 3.--Tilt coordinates and changes at the Uwekahuna field tilt-base  
 from December 1959 to October 1961

[In general, tilting toward the northwest at Uwekahuna indicates swelling of Kilauea and tilting toward the southeast indicates subsidence]

Dates	Tilt coordinates		Rate (u-rad/mo)	Azimuth
	N-S	E-W		
12/28/59 to 3/28/60	518	480	118	S. 34° E.
3/28/60 to 7/5/60	219	679	19	S. 32° E.
7/5/60 to 9/16/60	216	678	1	S. 21° W.
9/16/60 to 11/29/60	283	609	39	N. 46° W.
11/29/60 to 2/23/61	375	548	38	N. 34° W.
2/23/61 to 5/8/61	444	514	31	N. 26° W.
5/8/61 to 6/26/61	468	503	16	N. 25° W.
6/26/61 to 7/22/61	477	492	16	N. 51° W.

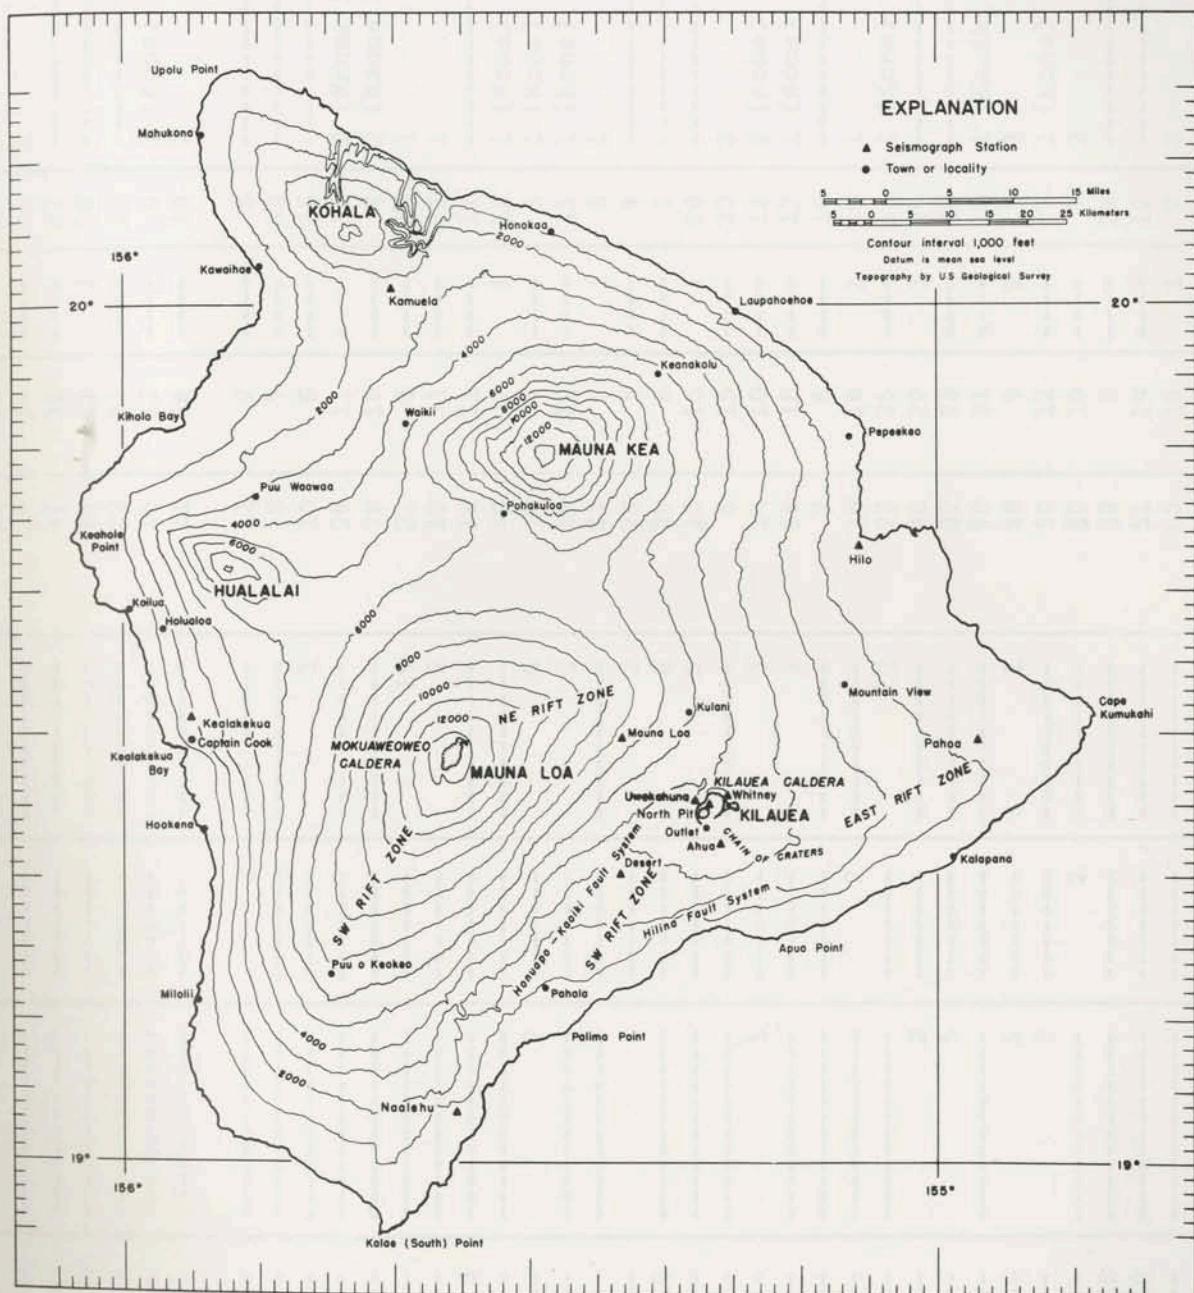

Figure 3.--Map of the island of Hawaii showing seismograph stations operated by the Geological Survey and localities mentioned in the text. Epicenters of local earthquakes are given in terms of geographic coordinates, which are indicated at the edges of the map.

Table 4.--Numbers of earthquakes and minutes of tremor recorded on seismographs around Kilauea caldera (U, M, A, D, and N)

[Tremor is separated into three categories--(1) deep, (2) intermediate, and (3) shallow--on the basis of relative amplitudes on seismographs in the summit region. Unless otherwise stated, tremor is presumed to be associated with movement of magma within the central complex of Kilauea.

Halemaumau rock slides (4) are detected by the characteristic record they produce on the North Pit seismograph.

Earthquake categories are: 5, shallow earthquakes in the Kilauea caldera region; 6, shallow earthquakes along the SW. rift zone of Kilauea and the adjacent portion of the Kaoiki fault system; 7, earthquakes along the eastern half of Kilauea's east rift zone; 8, earthquakes from a source about 30 km beneath Halemaumau (SE. edge of Kilauea caldera); 9, earthquakes from other regions: Kona, Mauna Kea, etc. ]

Table 5.—Local earthquakes recorded by seismographs of the U.S. Geological Survey,  
 October, November, and December, 1961.

[Except for smaller earthquakes of special interest, only earthquakes with magnitudes of 2.5 or greater are listed. Origin time is Hawaiian standard. Origin time is Hawaiian standard.

In the following list some origin times are followed only by "KM 30" and a statement of magnitude. These are all members of a continuing family of quakes noted in other reports as well. They were especially predominant in this quarter and thus are listed in this abbreviated fashion. The most accurately located mean epicenter for this group is under Halemaumau at a depth of 30 km ( $19^{\circ}24.1' N.$ ,  $155^{\circ}17.1' W.$ )  
 ]

Table 6.--Distant earthquakes

[Times are reported in Greenwich civil time which is 10 hours faster than Hawaiian standard time. A "c" following the time of P indicates compressional first motion; a "d" indicates dilatational first motion. Station symbols, locations, and instrumentation are presented in Summary 21. Magnitudes calculated from the Hawaii seismograms are followed by (HVO). Location of epicenter, origin times, and focal depths, and magnitudes reported by other institutions are taken from "Preliminary Determination of Epicenters" published by the U.S. Coast and Geodetic Survey]

Off coast of Oregon.							

The following bibliography is furnished to provide references to recent publications by the staff at the Hawaiian Volcano Observatory. Many of the publications are either based upon, or supplementary to, data presented in these Summaries.

Recent H.V.O. contributions

- No. 176. Richter, D. H., Moore, J. G., and Haugen, R. T., 1962, Recent growth of Halemaumau, Kilauea Volcano, Hawaii: U.S. Geol. Survey Prof. Paper 450-B, p. B53-B56.
- No. 173. Murata, K. J., and Richter, D. H., 1961, Magmatic differentiation in the Uwekahuna laccolith, Kilauea Caldera, Hawaii: Jour. Petrology, v. 2, no. 3, p. 424-437.
- No. 172. Krivoy, H. L., and Eaton, J. P., 1961, Preliminary gravity survey of Kilauea Volcano: U.S. Geol. Survey Prof. Paper 424-D, p. 205-208.
- No. 171. Ault, W. U., Richter, D. H., and Stewart, D. B., 1962, A temperature measurement probe into the melt of the Kilauea Iki lava lake in Hawaii: Jour. Geophys. Research, v. 27, no. 2, p. 2809-2812.
- No. 170. Richter, D. H., and Murata, K. J., 1961, Xenolithic nodules in the 1800-1801 Kaupulehu Flow of Hualalai Volcano: U.S. Geol. Survey Prof. Paper 424-B, p. B215-B217.
- No. 169. Wentworth, C. K., Powers, H. A., and Eaton, J. P., 1961, Feasibility of a lava-diverting barrier at Hilo, Hawaii: Pacific Science, v. 15, no. 3, p. 352-357.
- No. 168. Eaton, J. P., Richter, D. H., and Ault, W. U., 1961, The Tsunami of May 23, 1960, on the Island of Hawaii: Seismol. Soc. America Bull., v. 51, no. 2, p. 135-137.
- No. 167. Ault, W. U., Eaton, J. P., and Richter, D. H., 1961, Lava temperatures in the 1959 Kilauea eruption and cooling lake: Geol. Soc. America Bull., v. 72, p. 791-794.
- No. 166. Richter, D. H., and Murata, K. J., 1960, Xenolithic nodules in the 1800-1801 Kaupulehu Flow of Hualalai Volcano and their petrologic implication: Hawaiian Acad. Science Proc., 27 p.
- No. 165. Okamura, R. T., and Forbes, J. C., 1961, Occurrence of silicified wood in Hawaii: Am. Jour. Sci., v. 259, no. 3, p. 229-230.

- No. 164. Ault, W. U., 1960, Geochemical research during the 1959-60 activity of Kilauea Volcano: *Geochemical News*, p. 1-5.
- No. 163. Fraser, G. D., 1960, Pahala Ash: *U.S. Geol. Survey Prof. Paper 400-B*, p. 354-355.
- No. 162 Murata, K. J., 1960, Occurrence of CuCl emission in volcanic flames: *Am. Jour. Sci.*, v. 258, p. 769-772.
- No. 161. Eaton, J. P., and Murata, K. J., 1960, How volcanoes grow: *Science*, v. 132, no. 3432, p. 925-938.
- No. 160. Murata, K. J., 1960, A new method of plotting chemical analyses of basaltic rocks: *Am. Jour. Sci.*, Bradley Volume 258-A, p. 247-252.
- No. 158. Richter, D. H., and Eaton, J. P., 1960, The 1959-60 eruption of Kilauea Volcano: *The New Scientist*, v. 7, p. 994-997.
- No. 157. Eaton, J. P., 1959, A portable water-tube tiltmeter: *Seismol. Soc. America*, v. 49, no. 4, p. 301-316.
