Introduction

The annual bulletin of the Czechoslovak seismological stations Práhonice (PRU), Praha (PRA) and Kašperské Hory (KHC) will be published again in one volume for the whole year 1967. Data are arranged in a new form: contrary to the previous issues (e.g. [1]), the final interpretation of records is not given separately for each station but the earthquakes are arranged according to the time of arrival at the Czechoslovak stations with the readings of all stations. In most cases each event is introduced by the parameters quoted from the bulletin of I.S.C.; the parameters determined by the B.C.I.S. or by an individual seismological station are used for several shocks. Parameters are given in the following order: month, day (valid for the first arrival at the station), time of origin, epicentral zone, epicentre coordinates (with an accuracy up to 0.1°), focal depth in km, body wave magnitude and the quoted source. The stations are designed by the code used in I.S.C.. The readings on the records are chronologized, regardless of the possibility of their interpretation. If the amplitudes can be measured, the values of the period in seconds and amplitude in microns or millimicrons are given immediately after the pertinent phase. (The symbols u , μu are used instead of the correct μ , $\mu \mu$.) The values of periods and amplitudes of the P wave, given in parentheses without any denotation, have been measured in all cases on the records of short-period vertical seismographs (PRU: SVSN-4, KHC: SVKM-3) and have been used for determining the body wave magnitudes m . Periods and amplitudes of the P wave, measured on the records of the standard Kirmos seismographs, are denoted by the symbol PH (vector sum of the amplitudes on the horizontal components NS and EW) or PV (vertical component). All other amplitudes have been measured on the Kirmos seismograms and are denoted by the usual symbols (see List of Symbols). M is the magnitude determined from the maximum amplitude of the horizontal component of the surface waves. Magnitude values determined on the basis of another wave group have the corresponding denotation. The epicentral distance D is given in degrees with the accuracy of 0.1 degree; only the distances of the near shocks $D < 1^\circ$ are given up to 0.01° . The values of D have been quoted from the

I.S.C. bulletin or calculated on the computer. The values of D determined on the basis of the record analysis (mainly in the case of local shocks) are given in parentheses.

Besides the earthquakes with exact parameters and explosions with known epicentres also the local shocks are registered including only those events for which the epicentral distance $> 1^\circ$ could be determined for one station at least. All other local shocks have been published in a special list edited once per year by the station PRU (mimeographed).

The analysis of records of normal earthquakes has been made in accordance with Jeffreys-Bullen tables [2]. Gutenberg-Richter tables [3] have been used for deep earthquakes. Core waves have been interpreted in accordance with the Bolt's tables [4]. Single onsets in the distance interval $148^\circ - 154^\circ$ are interpreted as PKHP, if a positive deviation O - C is larger than 5 s, as the maximum amplitudes of the core wave group in the distances in question are connected with the PKHP branch. In the distance interval $143^\circ - 147^\circ$ (neighbourhood of the caustic) the core waves are interpreted only as PKP. Near shocks have been analysed according to the special local tables [5, 6, 7, 8].

Body wave magnitudes m have been calculated in accordance with the recommendations of the IASPEI Committee on Magnitudes (Zurich 1967). Magnitude values determined from other wave groups have been determined using special calibration curves [10, 11, 12].

The preliminary analysis of records in 1967 was performed by Mr. J. Nykles (PRU), Mr. J. Janský (PRA) and Mr. B. Závorka (KHC). Mrs. L. Ruprechtová, Miss J. Plomerová, Mrs. D. Procházková and Mr. J. Janský participated in the final interpretation and edition of the annual bulletin. The technical preparation of the issue was performed by Mrs. S. Černíková.

List of Symbols

(Symbols generally used are not introduced.)

- T_1 = free period of the seismometer
- T_2 = free period of the galvanometer
- V_o = static magnification
- V_m = maximum magnification
- $\xi : 1$ = damping ratio
- D_1 = damping constant of the seismometer
- D_2 = damping constant of the galvanometer
- σ^2 = coupling coefficient
- D = epicentral distance calculated using the geocentric coordinates of the station and the epicentre
- (D) = epicentral distance determined from the analysis of the record
- PKP = core wave, not precisely identified
- PKIKP = core wave travelling through the Earth's inner core
- PKMNP = core wave refracted on a discontinuity between the outer and inner core boundaries, preceding PKIKP at distance smaller than about 142° and following it at larger distances
- PKP₂ = core wave penetrating only into the outer core
- L, L_m = long period surface wave and its maximum
- LH = maximum horizontal amplitude of surface waves
- Q, Q_m = Love wave and its maximum
- R, R_m = Rayleigh wave and its maximum
- PH, PPH, SH = maximum horizontal amplitude of the wave in question measured on the record of the intermediate-period Kirnos seismograph
- PV, PPV, SV = maximum vertical amplitude of the wave in question measured on the record of the intermediate-period Kirnos seismograph
- MPH, MPV, MPPH, MSH = magnitude determined using the amplitudes mentioned above
- M = body wave magnitude determined using the maximum P amplitude measured on the record of the short period vertical seismograph
- M = surface wave magnitude
- K = characteristics of the microseisms
- 1 = microseisms in regular groups
- 2 = continuous motion
- 3 = irregular motion
- tt = record affected by an earthquake
- v = record affected by the wind

List of the Stations

Průhonice (PRU)

Station coordinates: $\varphi = 49^\circ 59.3' N$, $\lambda = 14^\circ 32.5' E$

Elevation: h = 302 m

Lithologic foundation: Algonkian layers

Instruments:

- I = Modified seismograph Wood-Anderson, mass 4g, magnetic damping, components N, E, photographic recording
- II = Vertical electrodynamic short-period seismograph SVSN, developed by V. Tobiáš and J. Stěpánek, galvanometric recording
- III = Electrodynamic intermediate-period seismograph Kirnos, components N, E, Z, galvanometric recording

Constants of the seismographs:

Instrument	Com	T_1 (s)	T_2 (s)	D_1	D_2	σ^2	V_o	T_m	V_m
I	N	2.6		0.57			1870	1.6	1975
	E	2.6		0.55			1870	1.6	2040
