RHODESIA METEOROLOGICAL SERVICESSEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA):** $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
 Litho. foundation: Dolomite and shales of the Middle Katanga System.
 Authority: Zambia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- CHILEKA (CIK):** $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
 Litho. foundation: Charnockitic granulites of the Basement Complex.
 Authority: Malawi Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- KAROI (KRR):** $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
 Litho. foundation: Granitic gneisses of the Zambesi type.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.
- BULAWAYO (BUL):** $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
 Litho foundation: Hornblend schists of the Bulawayan System.
 Authority: Rhodesia Meteorological Service.
 Instruments: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
 WWSS Station: SP magnification 100,000
 LP magnification 1,500
- CHIREDDZI (CIR):** $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
 Litho foundation: Gneisses or Charnockites of the Limpopo belt.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
 P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emersio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network ($17S 30E$).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES
SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA):** $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
 Litho. foundation: Dolomite and shales of the Middle Katanga System.
 Authority: Zambia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- CHILEKA (CIK):** $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
 Litho. foundation: Charnockitic granulites of the Basement Complex.
 Authority: Malawi Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- KAROI (KRR):** $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
 Litho. foundation: Granitic gneisses of the Zambesi type.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.
- BULAWAYO (BUL):** $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
 Litho foundation: Hornblend schists of the Bulawayan System.
 Authority: Rhodesia Meteorological Service.
 Instruments: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
 WSS Station: SP magnification 100,000
 LP magnification 1,500
- CHIRENDEZI (CIR):** $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
 Litho foundation: Gneisses or Charnockites of the Limpopo belt.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
 F. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES

SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA): $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
 Litho. foundation: Dolomite and shales of the Middle Katanga System.
 Authority: Zambia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- CHILEKA (CIK): $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
 Litho. foundation: Charnockitic granulites of the Basement Complex.
 Authority: Malawi Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- KAROI (KRR): $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
 Litho. foundation: Granitic gneisses of the Zambesi type.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.
- BULAWAYO (BUL): $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
 Litho foundation: Hornblend schists of the Bulawayan System.
 Authority: Rhodesia Meteorological Service.
 Instruments: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
 WSSS Station: SP magnification 100,000
 LP magnification 1,500
- CHIRWEDZI (CIR): $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
 Litho foundation: Gneisses or Charnockites of the Limpopo belt.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
 P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES

16 SEP 1969

SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA):** $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
 Litho. foundation: Dolomite and shales of the Middle Katanga System.
 Authority: Zambia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- CHILEKA (CIK):** $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
 Litho. foundation: Charnockitic granulites of the Basement Complex.
 Authority: Malawi Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- KAROI (KRR):** $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
 Litho. foundation: Granitic gneisses of the Zambesi type.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.
- BULAWAYO (BUL):** $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
 Litho foundation: Hornblend schists of the Bulawayan System.
 Authority: Rhodesia Meteorological Service.
 Instruments: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
 WWSS Station: SP magnification 100,000
 LP magnification 1,500
- CHIREDDZI (CIR):** $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
 Litho foundation: Gneisses or Charnockites of the Limpopo belt.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
 P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network ($17S \ 30E$).
- MM Intensity on the Modified Mercalli scale. |
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of M_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES

SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA):** $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
 Litho. foundation: Dolomite and shales of the Middle Katanga System.
 Authority: Zambia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- CHILEKA (CIK):** $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
 Litho. foundation: Charnockitic granulites of the Basement Complex.
 Authority: Malawi Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- KAROI (KRR):** $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
 Litho. foundation: Granitic gneisses of the Zambesi type.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.
- BULAWAYO (BUL):** $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
 Litho foundation: Hornblend schists of the Bulawayan System.
 Authority: Rhodesia Meteorological Service.
 Instruments: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
 WWSS Station: SP magnification 100,000
 LP magnification 1,500
- CHIREDDZI (CIR):** $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
 Litho foundation: Gneisses or Charnockites of the Limpopo belt.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
 P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES

SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA): $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
Litho. foundation: Dolomite and shales of the Middle Katanga System.
Authority: Zambia Meteorological Service.
Instrument: Three-component Willmore one-second seismograph.
Nominal magnification 20,000.
- CHILEKA (CIK): $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
Litho. foundation: Charnockitic granulites of the Basement Complex.
Authority: Malawi Meteorological Service.
Instrument: Three-component Willmore one-second seismograph.
Nominal magnification 20,000.
- KAROI (KRR): $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
Litho. foundation: Granitic gneisses of the Zambesi type.
Authority: Rhodesia Meteorological Service.
Instrument: Vertical Willmore one-second seismograph.
Nominal magnification 20,000.
- BULAWAYO (BUL): $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
Litho foundation: Hornblend schists of the Bulawayan System.
Authority: Rhodesia Meteorological Service.
Instruments: Three-component Willmore one-second seismograph.
Nominal magnification 20,000.
WSS Station: SP magnification 100,000
LP magnification 1,500
- CHIREZI (CIR): $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
Litho foundation: Gneisses or Charnockites of the Limpopo belt.
Authority: Rhodesia Meteorological Service.
Instrument: Vertical Willmore one-second seismograph.
Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

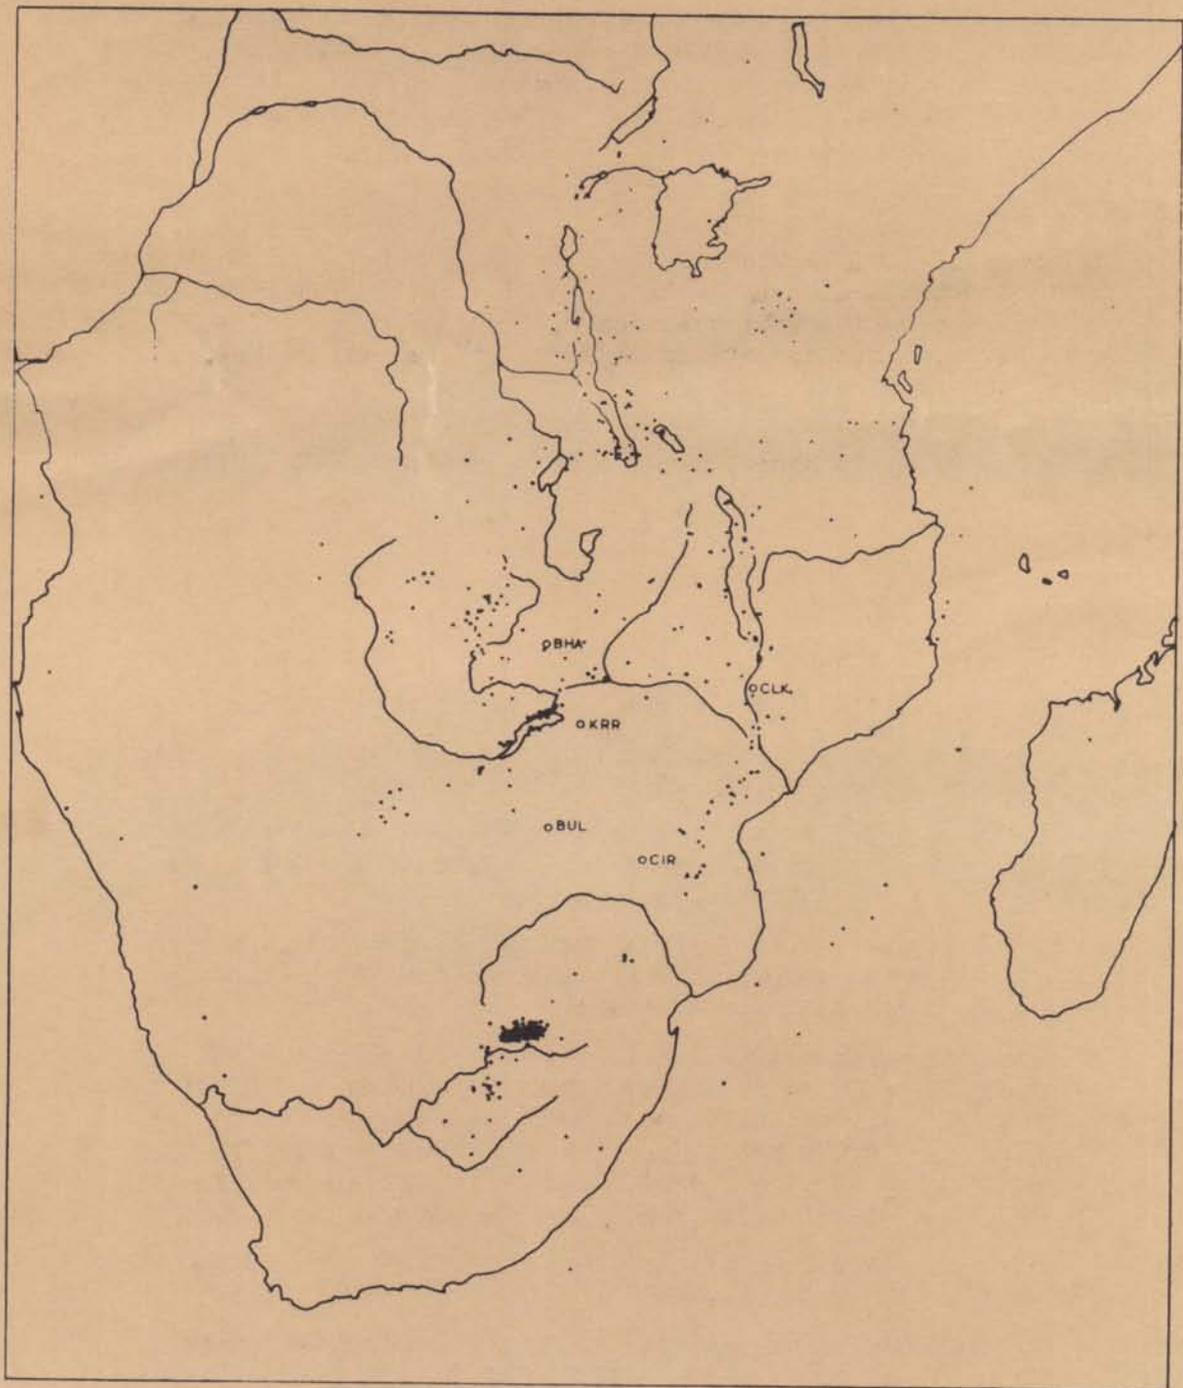

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

EPICENTRES OF LOCAL EARTHQUAKES: JULY 1968 TO JUNE 1969

EARTHQUAKES OF MAGNITUDE m_b 5.0 OR GREATER :

RHODESIA METEOROLOGICAL SERVICESSEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA): $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
Litho. foundation: Dolomite and shales of the Middle Katanga System.
Authority: Zambia Meteorological Service.
Instrument: Three-component Willmore one-second seismograph.
Nominal magnification 20,000.
- CHILFEKA (CLK): $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
Litho. foundation: Charnockitic granulites of the Basement Complex.
Authority: Malawi Meteorological Service.
Instrument: Three-component Willmore one-second seismograph.
Nominal magnification 20,000.
- KAROI (KRR): $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
Litho. foundation: Granitic gneisses of the Zambesi type.
Authority: Rhodesia Meteorological Service.
Instrument: Vertical Willmore one-second seismograph.
Nominal magnification 20,000.
- BULAWAYO (BUL): $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
Litho foundation: Hornblend schists of the Bulawayan System.
Authority: Rhodesia Meteorological Service.
Instruments: Three-component Willmore one-second seismograph.
Nominal magnification 20,000.
WWSS Station: SP magnification 100,000
LP magnification 1,500
- CHIREDDZI (CIR): $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
Litho foundation: Gneisses or Charnockites of the Limpopo belt.
Authority: Rhodesia Meteorological Service.
Instrument: Vertical Willmore one-second seismograph.
Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES
SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BWA):** $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
 Litho. foundation: Dolomite and shales of the Middle Katanga System.
 Authority: Zambia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- CHILINKA (CLK):** $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
 Litho. foundation: Charnockitic granulites of the Basement Complex.
 Authority: Malawi Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- KAROI (KRR):** $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
 Litho. foundation: Granitic gneisses of the Zambesi type.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.
- BULAWAYO (BUL):** $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
 Litho foundation: Hornblend schists of the Bulawayan System.
 Authority: Rhodesia Meteorological Service.
 Instruments: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
 WSSS Station: SP magnification 100,000
 LP magnification 1,500
- CHIRINDZI (CIR):** $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
 Litho foundation: Gneisses or Charnockites of the Limpopo belt.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.

Analysis Centre: Coetz Observatory, Meteorological Service,
 P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emersio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES

SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

KABWE (BHA): 14° 26.8' S; 28° 28.1' E; Alt. 1206 m.
Litho. foundation: Dolomite and shales of the Middle Katanga System.
Authority: Zambia Meteorological Service.
Instrument: Three-component Willmore one-second seismograph. Nominal magnification 20,000.

CHILWA (CIK): 15° 40.8' S; 34° 58.6' E; Alt. 781 m.
Litho. foundation: Charnockitic granulites of the Basement Complex.
Authority: Malawi Meteorological Service.
Instrument: Three-component Willmore one-second seismograph. Nominal magnification 20,000.

KAROI (KRR): 16° 51.1' S; 29° 37.1' E; Alt. 1380 m.
Litho. foundation: Granitic gneisses of the Zambesi type.
Authority: Rhodesia Meteorological Service.
Instrument: Vertical Willmore one-second seismograph. Nominal magnification 20,000.

BULAWAYO (BUL): 20° 08.6' S; 28° 36.8' E; Alt. 1341 m.
Litho foundation: Hornblend schists of the Bulawayan System.
Authority: Rhodesia Meteorological Service.
Instruments: Three-component Willmore one-second seismograph. Nominal magnification 20,000.
WSS Station: SP magnification 100,000
IP magnification 1,500

CHIRENDEZI (CIR): 21° 00.8' S; 31° 34.8' E; Alt. 430 m.
Litho foundation: Gneisses or Charnockites of the Limpopo belt.
Authority: Rhodesia Meteorological Service.
Instrument: Vertical Willmore one-second seismograph. Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service, P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES

SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA):** $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
 Litho. foundation: Dolomite and shales of the Middle Katanga System.
 Authority: Zambia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- CHILEKA (CIK):** $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
 Litho. foundation: Charnockitic granulites of the Basement Complex.
 Authority: Malawi Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- KAROI (KRR):** $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
 Litho. foundation: Granitic gneisses of the Zambesi type.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.
- BULAWAYO (BUL):** $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt. 1341 m.
 Litho foundation: Hornblend schists of the Bulawayan System.
 Authority: Rhodesia Meteorological Service.
 Instruments: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
 WWSS Station: SP magnification 100,000
 LP magnification 1,500
- CHIREDDZI (CIR):** $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
 Litho foundation: Gneisses or Charnockites of the Limpopo belt.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
 P. O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or P' phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

- GM Character of phase, and direction of the first ground motion of P or P'.
- e Emergio; the phase emerges gradually from the background.
- i Impetus; the phase is impulsive and clearly defined.
- ei The phase shows an emergent beginning, followed by a sharp increase in amplitude.
- R The first motion is downwards, or towards the epicentre; the motion is rarefactional. A lower case r indicates a weakly rarefactional first motion.
- C The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
- DA The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or P' in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
- BUL The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
- CGS The epicentral and magnitude data are determined by the U. S. Coast and Geodetic Survey (USCGS).
- Distant The epicentre is more than about 30° from the approximate centre of the local station network (17S 30E).
- MM Intensity on the Modified Mercalli scale.
- ? Indicates an uncertain statement.
- () The estimated uncertainty in the quantity in brackets is between 4 and 10 units of the last digit quoted. E.g., a latitude given as (16.4S) is thought to be uncertain by between 0.4 and 1.0 degree.
- Mag Magnitude. Locally-determined magnitudes are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).

RHODESIA METEOROLOGICAL SERVICES

SEISMOLOGICAL BULLETIN

The following stations contribute records for analysis and publication in this Bulletin:

- KABWE (BHA):** $14^{\circ} 26.8' S$; $28^{\circ} 28.1' E$; Alt. 1206 m.
 Litho. foundation: Dolomite and shales of the Middle Katanga System.
 Authority: Zambia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- CHILEKA (CLK):** $15^{\circ} 40.8' S$; $34^{\circ} 58.6' E$; Alt. 781 m.
 Litho. foundation: Charnockitic granulites of the Basement Complex.
 Authority: Malawi Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
- KAROI (KRR):** $16^{\circ} 51.1' S$; $29^{\circ} 37.1' E$; Alt. 1380 m.
 Litho. foundation: Granitic gneisses of the Zambesi type.
 Authority: Rhodesia Meteorological Service
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.
- BULAWAYO (BUL):** $20^{\circ} 08.6' S$; $28^{\circ} 36.8' E$; Alt 1341 m.
 Litho. foundation: Hornblend schists of the Bulawayan System.
 Authority: Rhodesia Meteorological Service.
 Instrument: Three-component Willmore one-second seismograph.
 Nominal magnification 20,000.
 WWSS Station: SP magnification 100,000.
 LP magnification 1,500.
- CHIREZI (CIR):** $21^{\circ} 00.8' S$; $31^{\circ} 34.8' E$; Alt. 430 m.
 Litho foundation: Gneisses or Charnockites of the Limpopo belt.
 Authority: Rhodesia Meteorological Service.
 Instrument: Vertical Willmore one-second seismograph.
 Nominal magnification 20,000.

Analysis Centre: Goetz Observatory, Meteorological Service,
 P.O. Box 562, Bulawayo, Rhodesia.

CRITERIA FOR PUBLICATION

To qualify for publication an earthquake must be of magnitude 2 or more. Also, in the case of local earthquakes (nearer than about 30°) at least one station must record a clear P phase. In the case of distant earthquakes, at least two stations must record clear P or PKP phases.

DISTANCES

Distances of local earthquakes are determined by means of travel-time curves developed at this Centre. For distant earthquakes, the standard Jeffreys-Bullen tables are used.

Where given, distances are in degrees ($1^\circ = 111.11 \text{ Km}$).

TIMES

Times are given in hours, minutes and seconds of GMT (UT).

GLOSSARY

GM	Character of phase, and direction of the first ground motion of P or PKP.
e	Emersio; the phase emerges gradually from the background.
i	Impetus; the phase is impulsive and clearly defined.
D	The first motion is downwards, or towards the epicentre; the motion is dilatational. A lower case d indicates a weakly dilatational first motion.
C	The first motion is upwards, or away from the epicentre; the motion is compressional. A lower case c indicates a weakly compressional first motion.
DA	The double-amplitude (peak-to-peak) of the record in millimetres. The double-amplitude is written on the same line as the phase to which it refers; usually P or PKP in distant earthquakes, and the S-L complex (the "maximum amplitude") in local earthquakes. In some cases a double-amplitude is given for more than one phase.
BUL	The epicentral and magnitude data are determined by Goetz Observatory, Bulawayo.
CGS	The epicentral and magnitude data are determined by the U.S. Coast and Geodetic Survey (USCGS).
Distant	The epicentre is more than about 30° from the approximate centre of the local station network (175 30E).
MM	Intensity on the Modified Mercalli Scale.
?	Indicates an uncertain statement.
()	The quantity in brackets is uncertain.
Mag	Magnitude. Locally-determined magnitude are based on the double-amplitude of the S-L complex, after Richter (1935). However, the station constants and distance-amplitude relationship have been slightly adjusted to make the local magnitudes agree as closely as possible with magnitudes published by USCGS. The local magnitudes can therefore be taken as being estimates of m_b of Gutenberg and Richter (1956).
